

3.5M PEDESTRIAN BARRIER INSTALLATION GUIDE

The 3.5m pedestrian barrier is an ideal solution for managing low level perimeter security around a site and controlling foot traffic during events.

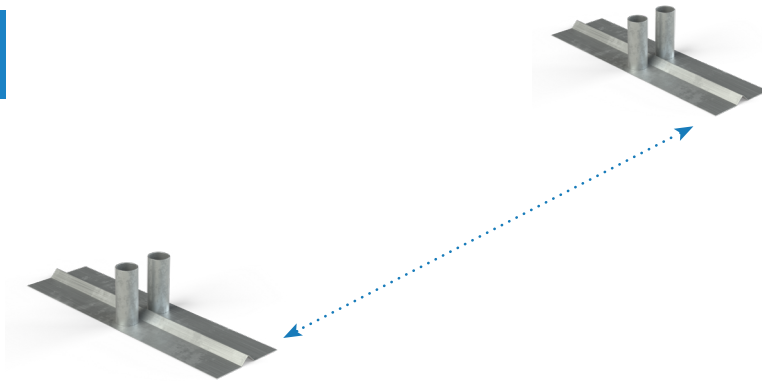

People to Install:

Equipment / Accessories Needed:

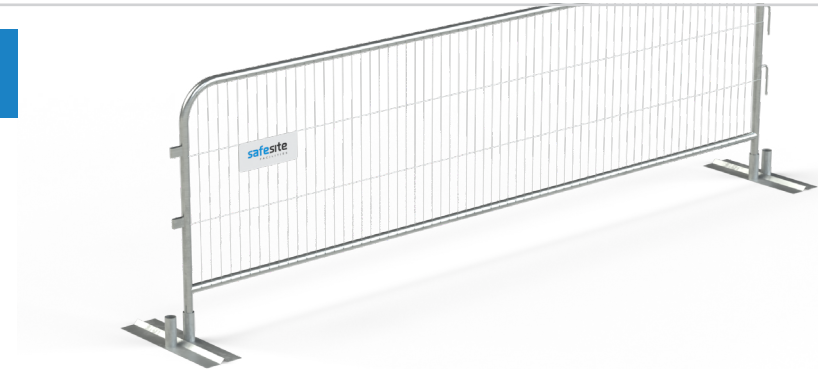

- Fence feet
- Coupler

1

Place the fence foot on the ground and walk out the length of the first barrier, then place the second foot on the ground. Set down each barrier alongside your desired fence line.

2

Place the leg of one end of the barrier in the foot, and then second in the next.

3

Connect the ends of each barrier together using a coupler.

4

Repeat steps 1, 2 and 3.

Useful Tip: You can add additional wind resistance to your panels by adding ballast to each foot, or the lower rail.

Wear the appropriate PPE for this task
